

Hillcrest Park Parc Hillcrest

Where you are standing right now used to be under water over 10,000 years ago. This water body was known as Glacial Lake Agassiz. As the glacier moved, it scraped the ground you are standing on, melted and left behind the waters of Lake Superior.

L'endroit où vous vous trouvez maintenant était sous l'eau il y a plus de 10 000 ans. Cette étendue d'eau était connue sous le nom de lac glaciaire Agassiz. En bougeant, le glacier a raclé la terre sur laquelle vous vous trouvez, a fondu et a laissé derrière lui les eaux du lac supérieur.

WHEN I VISITED, THE MOON WAS:

Imagine a large ice block moving across an egg carton. As the ice block moves, it becomes smaller and melts, leaving water in small depressions (holes) in the Earth.

Clue: If you were a hungry bee, you would love this part of Hillcrest Park!
